How does a solar inverter work?

Most homes and appliances run on alternating current (AC). This is where the solar inverter comes in. Put simply, a solar inverter converts the DC electricity generated by your solar panels into AC electricity that can be used in your household or fed back into the power grid. Without it, all that solar energy would be essentially unusable.

What is a solar inverter?

A solar inverter is the electronic heart of your solar power system--a sophisticated device that converts the direct current (DC) electricity generated by your solar panels into the alternating current (AC) electricity that powers your home and feeds into the electrical grid. Think of it like a translator at the United Nations.

Why is inverter technology important?

Inverter technology also plays a crucial role in managing how power flows through your system. In a typical grid-tied system, the inverter ensures your home uses solar power first, before drawing energy from the grid.

Do I need a solar inverter?

Unless you're living off-grid with a system that was intentionally planned to run on full DC power (which is rare), you need an inverter to make your solar energy usable. If you're connected to the grid, your inverter ensures that your solar power syncs up perfectly with the electricity flowing through the grid.

Getting started with solar can be hugely overwhelming, especially if you're not familiar with the equipment, terminology, or how anything works. Even if you're a total beginner, you've probably ...
