How big is an offshore wind turbine?

Offshore wind turbines typically employ much larger blades due to the expansive space and stronger winds available at sea. These blades can regularly exceed 100 meters in length, with some prototypes reaching up to 150 meters (around 492 feet). The GE Haliade-X offshore turbine, for example, uses blades approximately 107 meters (351 feet) long.

What is the longest wind turbine blade?

So far, the longest wind turbine blade on record is that of the Vestas-V236, which is 115.5 meters long. The Siemens Gamesa SG 14-222 DD is 108 meters (354.3 ft.) long. GE Haliade-X was the first wind turbine to introduce extra-long turbine blades in 2019, with a 107-meter (351 ft.) long blade.

How do wind turbine blade dimensions affect energy production?

The wind turbine blades are the elongated objects protruding from the center of the motor. They are anywhere from 50 meters to 120 meters (164 ft. to 393.7 ft.). Wind flows through the blade and decreases air pressure on the other side. Therefore, the blade dimensions play a big role in determining energy production.

How big is a wind turbine blade?

This blade at Wolfe Island Wind Farm in Canada is 49 meters long. Source: Wikimedia Wind turbine blade size plays a big role in the amount of energy a turbine can produce. Simply put, larger blades equal more power, which is why there's been a consistent trend toward bigger turbines in the wind energy industry.

The tower stands 248 meters tall, but from base to blade tip, the turbine reaches a staggering 260 meters.

The latest Mangshan wind turbine blades stretch like aerial superhighways, with modern designs reaching 68-80 meters in length - that's longer than three Olympic-sized swimming pools end-to-end!

According to recent studies, the average length of a wind turbine blade is about 60 meters. However, the latest blades have reached lengths of up to 100 meters or even more.

The scale of the blades has gradually outpaced the height of their tower counterparts, especially in the offshore setup. The colossal GE Haliade-X, for instance, features blades that make ...

Did you know that the longest wind turbine blades now measure an astonishing 115.5 meters, nearly as tall as the Statue of Liberty? This impressive dimension is not just a feat of ...

In 2023, the average rotor diameter of newly-installed wind turbines was over 133.8 meters (~438 feet)--longer than a football field, or about as tall as the Great Pyramid of Giza. Larger ...

Modern onshore wind turbines typically have blades ranging between 40 and 70 meters in length. Offshore turbines, often built at a grander scale, can exceed 80 meters per blade. To put that in ...
