Kepler-90 is a Sun-like star located approximately 2,545 light-years from Earth. It is notable for hosting a planetary system with the same number of confirmed planets as our own Solar System, making it ...

Kepler-90 is a G-type main-sequence star located 2,545 light years away from Earth in the constellation Draco. It is most notable for its planetary system of eight planets, equal to to the number of planets in ...

Kepler 90 is located 2835.96 light years or 869.49 parsecs from the Earth based on the latest parallax records from the Hipparcos satellite. It would take 2835.96 years travelling at the ...

The star Kepler-90 has apparent magnitude of 14.0, with absolute magnitude of 4.3. It is 1.1 times more massive and 1.2 times bigger compared with our Sun. The surface temperature is 5930 with its ...

Kepler-90, also designated 2MASS J18574403+4918185, is an F-type star located about 2,790 light-years (855 pc) from Earth in the constellation of Draco. It is notable for being the only confirmed ...

Kepler 90 is a star in the constellation of Draco. It is too faint to be seen in the northern hemisphere night sky without a telescope. Kepler 90 distance from Earth is 2835.96 light years away.

Yellow star Kepler-90 is located 2836 light years away from the Sun. It is a single star of spectral class G0 V, that has 120 % of solar mass. There are multiple known exoplanets in this system.

Kepler-90 i is a super Earth exoplanet that orbits a G-type star. Its mass is 2.3 Earths, it takes 14.4 days to complete one orbit of its star, and is 0.120138 AU from its star.

Kepler-90, also designated 2MASS J18574403+4918185, is a F-type star located about 2,790 light-years (855 pc) from Earth in the constellation of Draco. It is notable for being the only confirmed planetary ...

Kepler-90, also designated 2MASS J18574403+4918185, is a G-type star located about 2,790 light-years (855

Kepler 90 location

pc) from Earth in the constellation of Draco. It is notable for possessing a planetary ...
