What makes Paris a good data center?

Security is at the top of the list of Paris data centers: it is designed using cutting-edge technologies to protect sensitive information, for example, through multi-layered security protocols comprised of biometric access controls, 24-hour surveillance, and fire prevention systems.

How much electricity does a data centre use?

According to Aurora analysis, unlike other sectors, data centres exhibit highly stable electricity demand throughout the day, varying by only 5% intraday. However, it suggests that seasonal variations of up to 23% occur due to cooling needs, which can represent up to 40% of total energy consumption for these facilities.

Is a data center a storage facility?

Indeed, from a fiscal standpoint, the French Administrative Supreme Court has ruled that a data center is not a storage facility (CE, 11 October 2022, no. 463134).

How efficient is a data centre?

Modern data centres can achieve PUE ratings of 1.1, with further efficiency gains expected as the sector matures. The PUE metric measures the ratio of electricity consumed to power the entire data centre versus electricity consumed by IT equipment alone.

As a trusted and reliable partner to data centers and UPS system providers for decades, Exide Technologies supports its customers with a full suite of advanced energy storage solutions.

The different types of energy storage technologies used in data centers include lithium-ion batteries, lead-acid batteries, flywheel energy storage, and compressed air energy storage.

Exide Technologies, a European battery energy storage solutions (BESS) provider, rolled out its latest products at Data Centre World Paris 2025, designed for AI data centers. The company ...

Several major data center projects were announced at this year's "Choose France" summit, which comes on the heels of the announcement of a EUR109 billion investment at the 2025 ...

For operators and investors, France remains an attractive market -- with a favorable energy mix (notably

Paris data center energy storage

nuclear and renewables), competitive connectivity and a skilled workforce. But ...

France is set to become a significant data centre powerhouse, according to Aurora Energy Research, as electricity demand is due to surge 74% by 2050. The research finds that the French ...

OpCore's Paris DC5 is an industrial-scale, high-density, and energy-efficient data center facility engineered to meet the demanding requirements of international hyperscalers, offering unparalleled ...

As well, modern Paris data centers are found to be energy-friendly, fitting into France's environmental sustainability policy in that respect, thereby reducing carbon footprint emanating from large-scale ...

The data centre will be in Essonne, in the southern part of the Île-de-France region. This strategic location offers proximity to Paris while providing ample space for a large-scale facility.

Bracewell lawyers explore France's data center market, covering new regulations, permitting challenges, grid limitations, incentives, and heat reuse requirements for sustainable growth.
