In practice, it would probably take something on the order of 12 - 14 horsepower to turn the generator at full load. Depending on how your lawn mower engine is rated, it may or may not be ...

The generator doesn't care which direction it rotates--the only thing that matters is how the output leads are connected to the breaker that will close when the unit (prime mover and ...

Install a wide pulley on the generator the style normally used as an idler and use the generator as a belt tensioner, with the pulley riding against the outside of the belt = rotation reversed.

Reverse power is a condition in which the generator produces power in the opposite direction of the intended flow. Various factors, including mechanical and electrical misalignment, load ...

As some of you may have remembered the 7HP I had was a pullstart with a starter/generator running off of the flywheel side of the engine. The new kohler I got did not come ...

Electrician tells me that the dc voltmeters are indicating reverse polarity. Any thoughts on how this could happen or am I being yanked? If there's a shunt field, it is very well possible. All that is ...

I have a 2 bearing 6.5KW single phase statically excited Fairbanks Morse (Winpower) generator head that is configured to run CCW facing the shaft end. I want to reverse the rotation of ...

Assume you have a DC generator that spins (oh, lets say) clockwise but the PTO spins counter-clockwise. If you mount the generator directly to the end of the PTO then it will be spinning ...

The reason we do not want to flip it is the way it is ran off the side pulley of the tractor, it would have to be placed out the side and facing backwards. Here is a picture of it mounted.

Today for the first time ever, I plugged the Surge Guard 34730 into the generator. It passed the power through, but the screen is reading reverse polarity and faulty ground.

If, as done when reversing battery polarity, you are reversing current direction in BOTH field and armature, then it will not reverse rotation. Reversing rotation requires wiring change inside ...

If it is only reversed at the brushes, 0 wire is still grounded elsewhere in the generator and feeding power into it will cause a smoke show or worse. Theoretically, it should not matter which ...
