When they arrive, these can cause power outages and other serious effects on our planet. The first evidence that the Sun changes came from studies of sunspots, which are large, dark features seen ...

No, standard solar panels don't produce electricity during the night since they require sunlight to do that but new technology such as anti-solar panels and radiative cooling PV cells, can ...

New semiconductor devices could supplement solar cells by making electricity when the Sun isn't shining.

Solar panels can traditionally only produce power when the sun shines, but new developments are changing that. Scientists ...

The total number of sunspots has long been known to vary with an approximately 11-year repetition known as the solar cycle. The peak of sunspot activity is known as solar maximum and the lull is ...

"Night solar panels" are under development, aiming to enable energy generation at night and make up for the deficiency of solar generation.

Solar panels can traditionally only produce power when the sun shines, but new developments are changing that. Scientists have developed solar panels that can work in the dark ...

The research team has been working on groundbreaking technology that draws on radiative cooling, a phenomenon that takes place after the sun has set. It's an incredibly exciting ...

Solar flares are a sudden explosion of energy caused by tangling, crossing or reorganizing of magnetic field lines near sunspots. The surface of the Sun is a very busy place. It has ...

There's no question that solar panels need the sun's rays to generate electricity, therefore it's easy to assume

The sun has dark spotsSolar power generation

that you'll be without power if the sun isn't shining.

Thanks to the pioneering efforts of the Neutrino Energy Group, a new class of technology known as neutrino voltaics is enabling round-the-clock power generation, harnessing ...
