How effective is a user-side energy storage?

It can be seen that the user-side energy storage effectively realizes shifting electricity from the peak to off-peak periods and reducing the monthly peak net load. Peak shaving is more effective in months when the load peak is obvious and falls during the high electricity price period. The maximum peak shaving amount is 2687 kW in May and June.

What is user-side distributed energy storage?

The user-side distributed energy storage will keep part of the stored power for self-use. At the same time, they will sell the remaining idle power to energy storage operators through the cloud energy storage service platform to earn additional revenue.

What is user-side shared energy storage?

User-side shared energy storage is composed of interconnection and mutual benefit of adjacent energy storage devices in the same area, so the power loss in the power interaction process can be ignored [17].

Do users participate in Energy Storage pricing?

Thirdly, research on the user-side is mainly limited to residential area users, while there is limited research on users who can configure energy storage devices themselves, such as industrial users, without considering the initiative of such users to participate in energy storage pricing.
