The analysis was carried out for six different types of wind turbines, with a power ranging from 1.5 to 3.0 MW and a hub height set at 80 m.

WETO leads a portfolio of wind resource assessment projects that will help the industry more accurately predict and measure wind speed, wind direction, and ambient turbulence.

Wind resource assessment forms the foundation for any investment in wind power projects. At its core, this process involves collecting, analyzing, and interpreting wind data to gauge the available wind ...

Abstract The objective of this study is to perform an analysis to determine the most suitable type of wind turbine that can be installed at a specific location for electricity generation, using ...

This article presents an overview of the adequacy challenge, how wind power is handled in the regulation of capacity adequacy, and how wind power is treated in a selection of jurisdictions.

We demonstrate this approach to assess the spatial distribution of wind energy capacity potential in the Contiguous United States (CONUS). We find that the capacity-based power density ranges from 1.70 ...

Accurate assessment of the power generation capacity of the wind farm is the key basis for incorporating it into power system scheduling and other optimizing op

This is the author manuscript accepted for publication and has undergone full peer review but has with Large Energy Amounts Agency. of Wind Task not been through the copyediting, typesetting, ...

We achieve a global average capacity factor mean error of 0.006 and Pearson correlation of 0.865. In addition, we evaluate its performance against several aggregated and statistical sources ...
