In this study, the grinding path was first segmented, and an improved manufacturing material-removal model for grinding wind-turbine blade surfaces was established based on the blade ...

The majority of this work focuses on the toolpath generation. The algorithms were tested on a 5-m blade section, and the results were analyzed in terms of operation speed and accuracy. Finally, future work ...

To solve this problem, we propose a workflow for autonomous surface grinding of wind turbine blades. It includes damage analysis based on scans of the blade, subsequent trajectory ...

After flashing trimming, the leading and trailing edges have a small ridge that must be ground off to achieve the desired airfoil profile. The solution: capture the blade geometry as-built and process the ...

Polishing the edges is one of the most important steps in fixing blade flaws in wind turbines. Addressing the issues of large curvature variations and high time.

To address the challenge of automatically and efficiently grinding wind turbine blades, this article introduces a novel trajectory planning method for mobile robotic grinding wind turbine blade ...

Robots can safely trim, grind and sand wind turbine blades. ARVADA, CO --Engineers at the U.S. Department of Energy's National Renewable Energy Laboratory (NREL) are using robots to ...

Incorporating automation into wind turbine blade production has the potential to increase the viability of wind energy. The remainder of this work will focus on novel methods for automating ...

This precision grinding method allows blade damage to be removed with the utmost accuracy. This leaves the surface ready for a technician to reapply the balsa wood and fiberglass layers in order to ...

Research at the laboratory demonstrates the ability of a robot to trim, grind, and sand blades. Those necessary

Wind turbine blade grinding staggered

steps occur after the two sides of the blade are made using a mold and then bonded ...
